ABSTRACT

Intellectual disorders may manifest in a variety of ways, the majority of which arise between birth and infancy. Mild intellectual handicap may not be seen until the kid starts school. According to Kaneshiro (2015), the following are the most common symptoms of intellectual disability of Failure/ delay in developmental milestones like- sitting, crawling, standing and Walking Late and restricted language development or having trouble with talking and poor Communication skill. Failure/ difficulty or in personal care skills (e.g., potty training, dressing Grooming, motor, cleaning, washing and feeding self). Failure/ difficulty in cognitive functioning, characterized by poor planning Thinking, reasoning, decision making and problem-solving skills. Difficulty in demonstrating behaviors appropriate to age, gender and Circumstances as per social pattern. Poor/ failure in school performance. Failure/ difficulty to adjust in different situations and demand of new environment. Failure/problems to understand and follow social rules Attention deficits and difficulty in remembering. Difficulty to connect behaviors with its consequences. Problem to express any desire.
